SUMMARY

Software Engineering student at Uninter and data analyst at Vitru Educação, where I build the Python systems behind UniCesumar's academic planning. The main one is the faculty allocation optimizer (OR-Tools, FastAPI, React), which assigns about 200 instructors to more than 350 classes per module in minutes. In open-source projects I build LLM applications: RAG with hybrid search, document data extraction with FastAPI, and an agent that publishes videos with checked sources.

EXPERIENCE

Vitru Educação (UniCesumar) — Hybrid, Maringá, Brazil
Mid-level Data Analyst, Academic Planning — 03/2026 – Present

- Built the faculty allocation optimizer (Python, OR-Tools CP-SAT, FastAPI, React, TypeScript), which assigns about 200 instructors to more than 350 classes per module in minutes, work that used to take weeks in spreadsheets.
- Built the 2027 student enrollment forecasting model (Python, DuckDB, Parquet, Power BI), with 50 automated quality checks and error below 2% against actuals.
- Maintain in production the weekly curriculum pipeline for UniCesumar and Uniasselvi (Python, SQL Server), which reads 6 spreadsheet layouts through 4 validation layers.
- Moved the planned-vs-actual audits from Power Query to Python, over datasets of up to 40 million rows, with Power BI dashboards for managers and leadership.
- Rewrote in Python and Marimo the lab class demand vs. tutor capacity model, with a simulator by campus and city whose scenarios cut the shortfall from 27,400 to 21,300 hours.

Linoforte Móveis — Osvaldo Cruz, Brazil
Assistant Operator — 06/2022 – 12/2025

- Set up monitoring of production and quality KPIs, flagging recurring stoppages for corrective action.
- Mapped bottlenecks and downtime and proposed improvements that reduced rework and waste on the line.

PROJECTS (github.com/guilhermerissondev)

- Regulatory RAG Eval: question answering over 294 Brazilian Central Bank regulations with source citations (Python, BM25, embeddings, Gemini). Hybrid search raised MRR from 0.361 to 0.644 over keyword search.
- Procurement Triage Service: API that uses an LLM to extract data from Brazilian public procurement notices (PNCP) and only accepts values found in the PDF (Python, FastAPI, Gemini, Docker). US$ 0.028 per notice, 61 tests in CI.
- TikTok Viral Generator: agent that tracks 8 news sources, researches, scripts and publishes short videos with a source for every fact (Python, Pydantic, SQLite). Publishes 4 videos a day, with 691 tests.
- Silent Data Defects: command-line tool that profiles data quality in large datasets (Python, DuckDB, PyArrow). Processes 5 million rows in 4.8 s, 25x faster than ydata-profiling.
- Credit Risk Decision Engine: credit risk model with the approval cutoff set by expected profit (Python, LightGBM, SHAP). +24% profit with the same model.

EDUCATION

B.S. in Software Engineering — Uninter — 10/2026 – 2030 (in progress)
AI Software Engineer 4.0 Program (360 h) — Data Science Academy — 09/2026 – 12/2026 (expected)
Postgraduate Certificate in Data Science (360 h) — UniCesumar — 03/2026 – 10/2026
B.S. in Civil Engineering — FAI, Faculdades Adamantinenses Integradas — 2021 – 2025

SKILLS

Languages: Python, SQL, TypeScript
AI and LLM: RAG, hybrid search (BM25 + embeddings), structured output, LLM evaluation, agents, Gemini API
Backend: FastAPI, Pydantic, React, Docker, pytest, GitHub Actions, Git
Data and ML: pandas, DuckDB, Parquet, SQL Server, scikit-learn, LightGBM, OR-Tools (CP-SAT), Power BI
Spoken languages: Portuguese (native), English (professional), Spanish (intermediate)
